

Sahayak

Prototype Walkthrough

A voice-first AI work assistant for India's deskless workforce

Ideas for India 2026 · Inclusive Innovation for Bharat

The screenshots in this document are captured from a running prototype, not mockups.

Sahayak is a functional prototype: a FastAPI backend with intent routing, retrieval over a real SOP corpus, an action layer that writes to a mock HRMS, and a supervisor dashboard — all working end to end. Every screen below is a live interaction with that system.

The demo channel shown here simulates WhatsApp; production uses the WhatsApp Business API.

1 · Applying for leave by speaking plain Hindi

Ramesh, a housekeeping attendant, types or speaks “mujhe kal ki chhutti chahiye, tabiyat kharab hai” — no form, no portal, no English. Sahayak extracts the leave type and date, files the request against the HRMS, and returns a tracked ticket ID with its live approval status. He then asks how much leave he has left and gets his casual, sick and earned balance back in Hindi. On a conventional HR portal this is a login, a form and an English dropdown — which is why deskless workers never do it themselves.

2 · A safety question answered from the actual SOP, with its source shown

Asked “Needle lag gayi, kya karu?” in Roman Hinglish, Sahayak returns the hospital’s six-step needle-stick protocol — including the one-hour PEP window that determines the outcome — and cites the exact document and section it came from (Hospital Staff Safety SOP, Section 2.1). The citation is the point: the worker can verify it, and the hospital can audit it. Answers below a confidence threshold route to a human instead of guessing, which is what makes an LLM deployable in a clinical setting.

09:25 am

मेरी छुट्टी कितनी बची है?

09:25 am ✓✓

Ramesh जी, आपका छुट्टी बैलेंस:

- आकस्मिक (CL): 7 दिन
- बीमारी (SL): 6 दिन
- अर्जित (EL): 11 दिन

छुट्टी लेनी हो तो "छुट्टी चाहिए" बोलिए।

09:25 am

Needle lag gayi, kya karu?

09:25 am ✓✓

Ramesh जी, सही तरीका यह है:

1. घाव को दबाएं या चूसें नहीं।
2. तुरंत साबुन और बहते पानी से 5 मिनट धोएं।
3. तुरंत वार्ड इंचार्ज/सुपरवाइज़र को बताएं।
4. 1 घंटे के अंदर इमरजेंसी/कैजुअल्टी में रिपोर्ट करें — PEP दवा जल्दी शुरू करने पर सबसे असरदार है।
5. इंसिडेंट रजिस्टर भरें।
6. 6 हफ्ते, 3 महीने और 6 महीने पर खून की जांच कराएं।

3 · The same assistant, in Gujarati

Meena, a pathology lab attendant, asks about her payslip and tomorrow's shift in Gujarati. Language is a per-worker preference, not a separate deployment — the same retrieval and action layer serves every language. Salary deductions are a leading cause of mistrust and unclaimed PF/ESI entitlements among low-wage workers; being able to ask about them privately, in one's own language, removes the intermediary.

4 · A manufacturing SOP, in English, from a different document

Suresh, a CNC operator at a different employer, asks the machine start-up procedure in English and receives the five-step checklist cited to Machine Operations SOP, Section 4.1 — a different corpus from the hospital's. One system, multi-tenant document grounding: each employer's own SOPs answer their own workers. This is the difference between a chatbot and an inclusion layer that an enterprise can actually deploy.

5 · The supervisor side — support burden converted into insight

Every worker query feeds a live operations view: leave requests awaiting approval with the reason in the worker’s own words, an open grievance flagged priority, and a training-gap heatmap showing what the workforce actually does not know. Language mix and most-consulted SOPs tell HR where policy is unclear and where safety risk is concentrating. First-contact resolution sits at 89% with one unresolved query and one escalation — the loop that turns a cost centre into strategic data.
